Rosetta Radiology is now offering MR Arthrograms

Our new state of the art PET/CT is installed and scanning and our newest associate, **Dr. Mark Pinals** has extensive experience in MR Arthrography. We are now performing MRI Arthrograms at Rosetta Radiology.

MR Arthrography has improved sensitivity and specificity for evaluation of shoulders, hips and post-op knees.

- Shoulder: Superior to conventional MRI for evaluation of instability, labral tears and partial thickness rotator cuff tears.
- Hip: Excellent for evaluation of labral tears and Femeroacetabular Impingement.
- Knee: Differentiates recurrent meniscal tears from post-surgical scarring in the knee after surgical meniscal repair.

The procedure is quick and safe. Radiologist injects contrast into the joint under CT guidance. Patient is then escorted to the MRI suite where the diagnostic MRI Arthrogram imaging is performed.

As always, at Rosetta Radiology patients will receive courteous, professional care.
